

Bayes' Theorem

- Bayes' Theorem is a way of finding a probability when we know certain other probabilities.
- The formula is:

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

how often A happens *given that B happens*, written **P(A | B)**,

how often B happens *given that A happens*, written **P(B | A)**

and how likely A is on its own, written **P(A)**

and how likely B is on its own, written **P(B)**

- Let us say $P(\text{Fire})$ means how often there is fire, and $P(\text{Smoke})$ means how often we see smoke, then:
 - $P(\text{Fire} | \text{Smoke})$ means how often there is fire when we can see smoke
 - $P(\text{Smoke} | \text{Fire})$ means how often we can see smoke when there is fire
- “Forwards” $P(\text{Fire} | \text{Smoke})$ when we know “Backwards” $P(\text{Smoke} | \text{Fire})$

Example:

- dangerous fires are rare (1%)
- but smoke is fairly common (10%) due to barbecues,
- and 90% of dangerous fires make smoke

Solution

We can then discover the probability of dangerous Fire when there is Smoke:

$$P(\text{Fire} | \text{Smoke}) = P(\text{Fire}) P(\text{Smoke} | \text{Fire}) / P(\text{Smoke})$$

$$= 1\% \times 90\% / 10\%$$

$$= 9\%$$

So it is still worth checking out any smoke to be sure.

Remembering

- First think "AB AB AB" then remember to group it like: "AB = A BA / B"

$$P(A|B) = \frac{P(A) P(B|A)}{P(B)}$$

- The Bayes Rule provides the formula for the probability of Y given X. But, in real-world problems, you typically have multiple X variables.
- When the features are independent, we can extend the Bayes Rule to what is called Naive Bayes.
- It is called 'Naive' because of the naive assumption that the X's are independent of each other. Regardless of its name, it's a powerful formula.

When there are multiple X variables, we simplify it by assuming the X's are independent, so the **Bayes** rule

$$P(Y=k | X) = \frac{P(X | Y=k) * P(Y=k)}{P(X)}$$

where, k is a class of Y

becomes, Naive **Bayes**

$$P(Y=k | X_1..X_n) = \frac{P(X_1 | Y=k) * P(X_2 | Y=k) ... * P(X_n | Y=k) * P(Y=k)}{P(X_1) * P(X_2) ... * P(X_n)}$$
